$\qquad$

## 3.3: Summary Statistics: Measures of Center

## Class Prep Assignment

We Describe Four Characteristics of Data: Shape, Center and Spread, and Outliers
Example. The grades on the third exam for a MTH 95 class were as follows:
$\begin{array}{lllllllllllllllllll}82 & 74 & 67 & 81 & 49 & 84 & 52 & 91 & 66 & 75 & 96 & 73 & 71 & 78 & 49 & 86 & 85 & 62 & 58\end{array}$
a) Make a histogram of the data to determine its shape.

|  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |

## Shape of the Histogram:

Unimodal
Bimodal

Skewed to the Left
(Mean less than median)

Skewed to the Right
(Mean greater than median)

## Measures of Center or Average

Mean:

Median:
odd number of values:
even number of values:

Mode:
b) Arrange the grades above in order:
c) Find the mean
d) Find the median
e) Find the mode(s), if any
$\qquad$

## 3.4: Summary Statistics: Measures of Variation

Measures of Spread
Range:

Interquartile Range (IQR):

Standard Deviation:

Five-Number Summary and Boxplot: Minimum, $\mathrm{Q}_{1}$, Median, $\mathrm{Q}_{3}$, Maximum Continuing with the test scores in order, find the following:
$49,49,52,58,62,66,67,71,73,74,75,78,81,82,84,85,86,91,96$
f) Five-number summary:
g) Range:
h) Interquartile Range (IQR):
i) Draw and label the boxplot:

|  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |

## Outliers

j) Are there any outliers in this data?

## Which Measures to Use?

If the data is symmetric, use the mean and standard deviation If the data is skewed, use the median and the IQR
$\qquad$

## Standard Deviation

Standard Deviation The "average deviation from the mean." Can be approximated by the Range $\div 4$ if the data is evenly spread without outliers.

$$
s=\sqrt{\frac{\sum(x-\text { mean })^{2}}{n-1}}
$$

$49,49,52,58,62,66,67,71,73,74,75,78,81,82,84,85,86,91,96$

| Data | Deviation from Mean | Squared Deviation |
| :--- | :--- | :--- |
| 49 |  |  |
| 49 |  |  |
| 52 |  |  |
| 58 |  |  |
| 62 |  |  |
| 66 |  |  |
| 67 |  |  |
| 71 |  |  |
| 73 |  |  |
| 74 |  |  |
| 75 |  |  |
| 78 |  |  |
| 81 |  |  |
| 82 |  |  |
| 84 |  |  |
| 85 |  |  |
| 86 |  |  |
| 91 |  |  |
| 96 |  |  |
|  |  |  |

$$
s=\sqrt{\frac{\sum(x-\text { mean })^{2}}{n-1}}=
$$

Standard Deviation Approximation: Range/4. How do they compare in this case?
